

Title: COMPUTER SYSTEM FOR MANAGING LITIGATION RISK EARLY  
WARNING SYSTEM

ABSTRACT OF THE DISCLOSURE

A computer system includes a server computer, a plurality of client computers and a communication network that interconnects the server computer and the client computers. A first user of the computer system publishes a notification of a potential legal issue in the computer system and directs the notification to a second user. The notification is stored in a web page that is accessible to the second user. The second user accesses the web page and publishes a response to the notification. The response indicates whether a warning notice regarding the potential issue is warranted. Computer-based forms facilitate the preparation of the notification and the response. Menus in the forms facilitate the assignment of notification to the second user and the indication as to whether a warning notice is warranted.
